

What Should & Shouldn't Be Tested

Only test your code!

Don't test third-party code

Don't test what you can't change

Only Test Your Code

e.g. `fetch()` API

Don't test if it works as intended

Don't test your server-side code implicitly
via your client-side code

Write separate tests for your backend
code instead

DO Test your client-side reaction to
different responses & errors

Writing Good Tests

AAA

Arrange - **Act** - Assert

1

Only test **one thing**

Focus on the **essence** of a test when arranging

<

Keep your number of assertions (“expects”) **low**

Only Test One Thing

What is “one thing”?

One feature

e.g., validate input OR transform it
